Sammendrag

NILU - Norsk institutt for luftforskning gjennomfører på oppdrag fra Sauda kommune et måleprogram med meteorologi (vind, temperatur og stabilitet), luftkvalitet (PM₁₀) og metallanalyse av utvalgte filter fra svevestøvmålinger i Sauda. (Denne rapporten er en delrapport for perioden 01.04-30.09.2010).

Meteorologi

Dominerende vindretninger for hele måleperioden var fra øst og øst-sørøst (35,9%) og fra vest-sørvest (26,1%). Det var vindstille i 5,4% av tiden. Midlere vindstyrke for hele perioden var 1,6 m/s. De høyeste vindstyrkene forekom med vind fra vest (270°).

De meteorologiske dataene viste dominerende vind ned dalen som var et generelt trekk for hele regionen i denne perioden. Dette gir belastning mot stasjonen mer sjeldent enn vinteren 2010/2011 hvor dominerende vind var inn dalen, dvs. fra sydvest.

Forekomst av nøytrale atmosfæriske stabilitetsforhold, som inntreffer typisk ved vind og overskyet vær som fører til relativ god spredning, var høy i hele måleperioden (42,9%). Stabile atmosfæriske forhold som oppstår om vinteren og om natta ved lav vind og fører til dårlig spredning av forurensninger, ble oftest observert ved vind fra øst og forekom i 41,7% av måleperioden.

Luftkvalitet Søndenålia

NILU har sammenlignet måleresultatene med grenseverdiene i forskriftene til luftkvalitet fastsatt ved Kgl. Res. 4. oktober 2002 og Nasjonalt mål for luftkvalitet.

Luftkvaliteten i et område vurderes ved å sammenligne målinger eller beregninger av konsentrasjoner av luftforurensning med grenseverdier, sett ut fra virkning på helse og/eller vegetasjon. Begrepene grenseverdi og nasjonalt mål er tallverdier for forurensningsgrad. Grenseverdier er juridisk bindende, mens Nasjonalt mål er en målsetning.

På målestasjon Søndenålia ble det i hele måleperioden registrert 2 overskridelser av døgnmidlet grenseverdi for svevestøv (PM₁₀), på henholdsvis 51,1- og 94,4 µg/m³.

Metallanalysene viste i denne perioden en nedgang for de fleste målte parametre. Det ble målt relativt høye konsentrasjoner av mangan (Mn), men også for denne parameteren var det en betydelig reduksjon i nivået sammenlignet med tidligere målinger. Ingen av middelverdiene for komponentene i måleperioden gav overskridelser av EUs "Target values" eller WHOs retningslinjer som er årsmidlet. Det er derfor ikke noe som tyder på at konsentrasjonen av noen av de målte metaller vil overskride grenseverdier for luftkvalitet som årsmiddel.

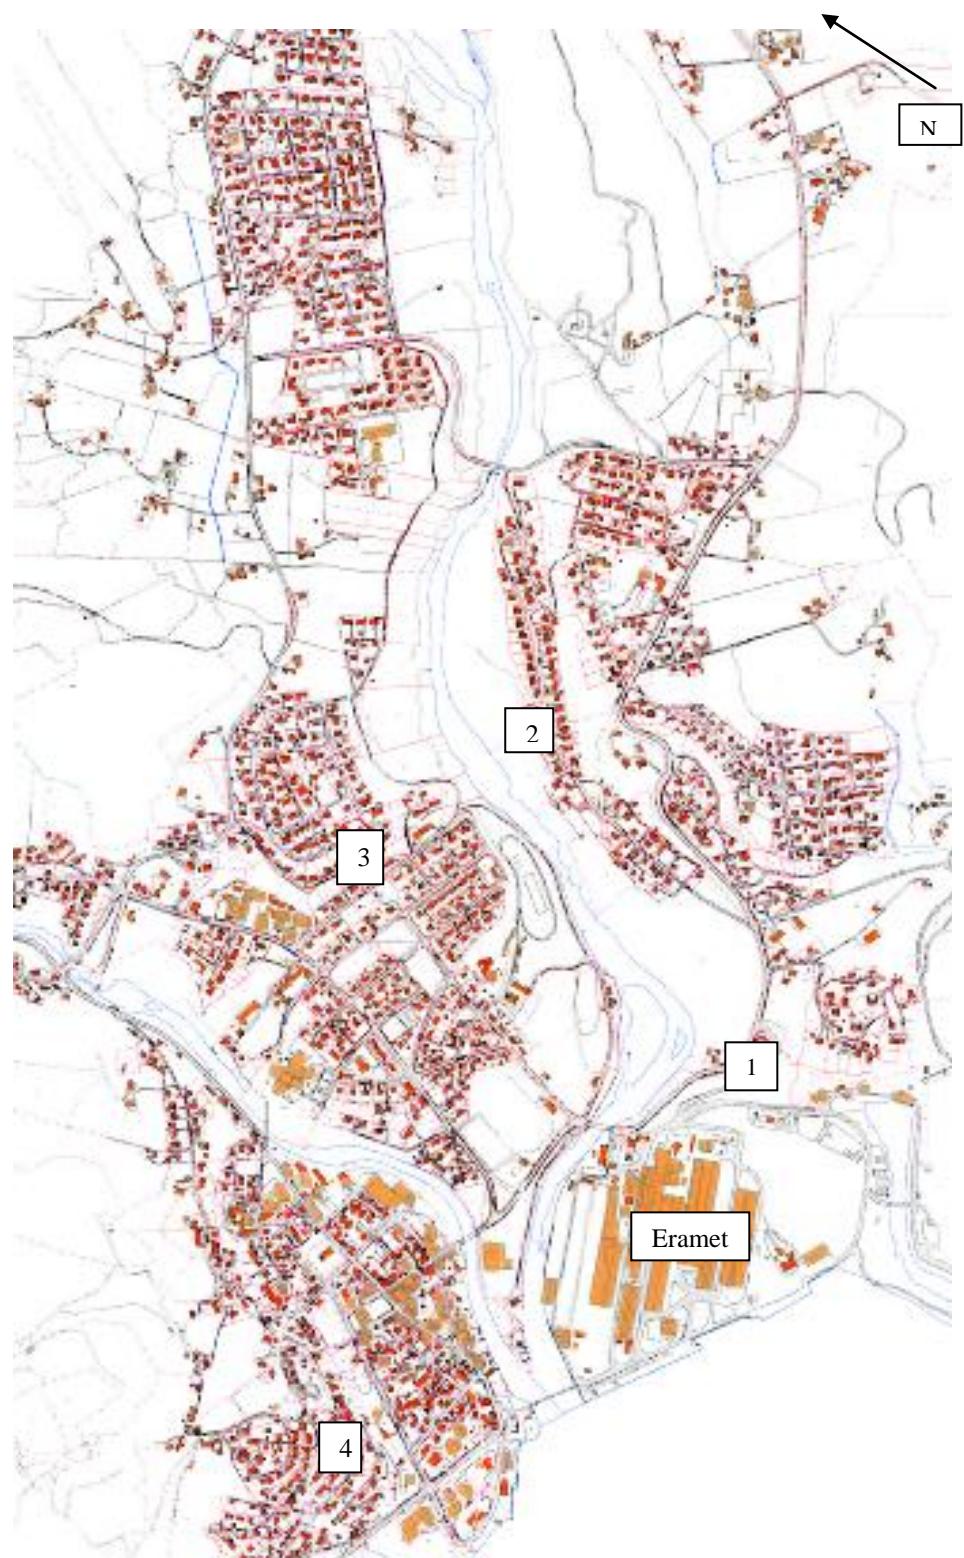

Målinger av meteorologi og luftkvalitet i Sauda april– august 2011

1 Innledning

NILU - Norsk institutt for luftforskning har på oppdrag fra Sauda kommune utført målinger av meteorologi (vind, temperatur og stabilitet), luftkvalitet (PM_{10}) og metallanalyse av utvalgte filter fra svevestøvmålingene. Målingene startet i april 2008 og dette er sjette og siste rapport som omhandler perioden april – august 2011.

2 Måleprogram

Figur 1 viser kart med målestasjonen inntegnet. I denne måleperioden er det blitt målt meteorologi (stasjon 1) og luftkvalitet på Søndenålia (stasjon 2). Målingene omfatter kontinuerlige målinger av PM_{10} ved bruk av Eberline og innsamling av døgnprøver av partikler på filtre for metallanalyser ved bruk av instrumenttype Kleinfiltergerat.

Figur 1: Stasjonsplassering i Sauda. 1) Meteorologiske målinger 2) Søndenålia, 3) Brekke, 4) Utsikten. Stasjon 3 og 4 var ikke i drift i perioden.

3 Datatilgjengelighet

Tabell 1 gir en oversikt over måleperiode og hvilke parametre som har vært målt i Sauda.

Tabell 1: Oversikt over måleprogram, meteorologiske parametre i Sauda i perioden 01.04-31.08.2011

Parameter	Enhett	Instrument	Midlingstid
Temperatur (TT)	°C	Aanderaa	1 time
Temperaturdifferanse (dT)	°C	"	"
Vindretning (DD)	grader	"	"
Vindstyrke (FF)	m/s	"	"
Vindkast (gust)	m/s	"	"
Svevestøv Søndenålia	µg/m ³	PM ₁₀ -mon.	"

Datadekningen for målingene er vist i Tabell 2. Alle data er gitt i Vedlegg A.

Tabell 2: Datadekning i prosent av tid for de aktuelle parametre i Sauda i perioden 01.04-31.08.2011.

Parameter	2011				
	Apr	Mai	Jun	Jul	Aug
Vindstyrke	100	100	100	100	100
Vindkast (Gust)	100	100	100	100	100
Vindretning	99,9	99,7	99,9	99,9	99,9
Temperatur	19,3	0	81,5	100	100
Temperaturdiff	100	58,1	80,0	100	100
Svevestøv Søndenålia	98,8	99,9	100	100	100

Det var dårlig datadekning for temperatur i april og mai og delvis i juni. Det var også dårlig datadekning for stabilitet/temperaturdifferanse i mai. For øvrig var datadekningen for alle parametre i måleperioden god. Dårlig datadekning skyldes svikt i måleinstrumenter.

4 Meteorologiske målinger

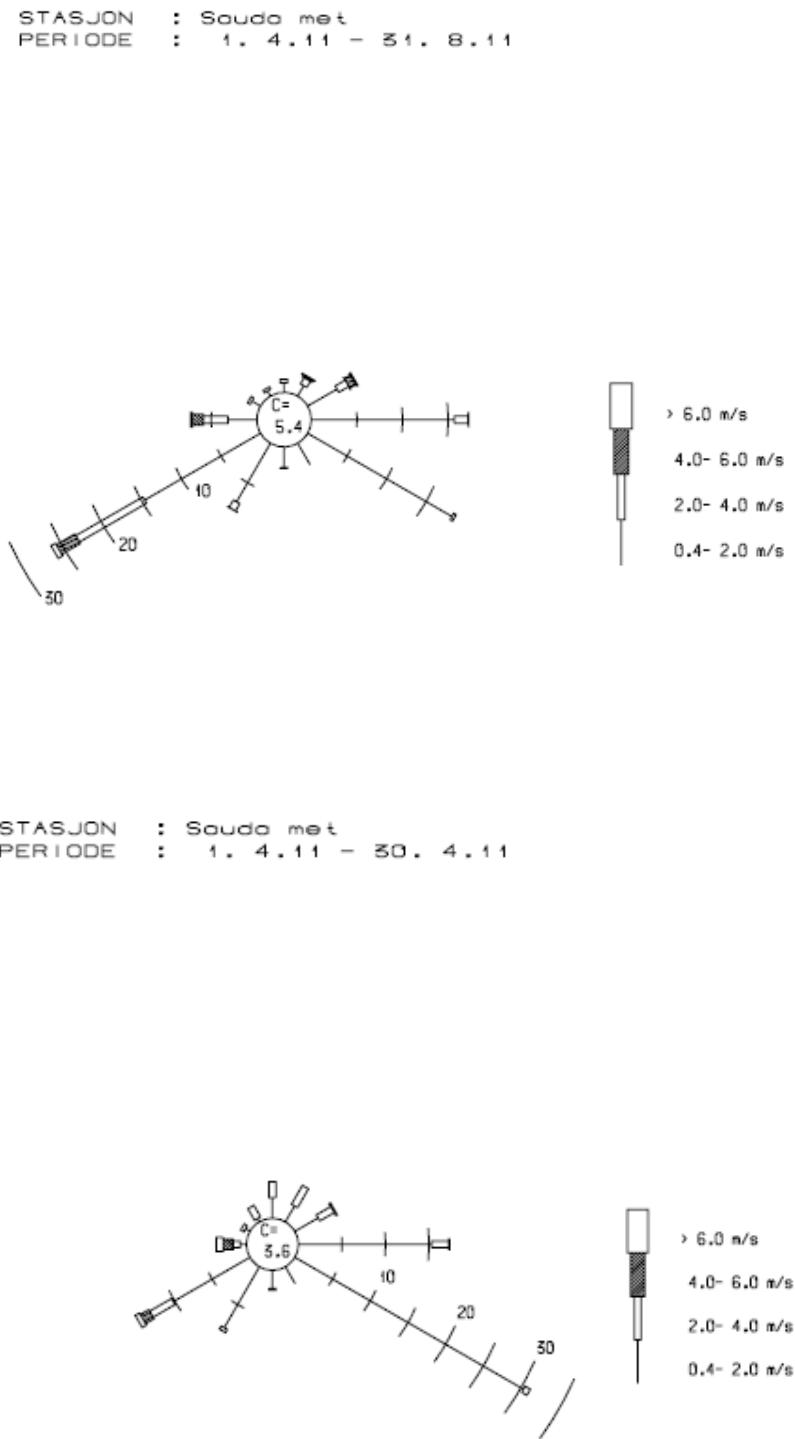

Det er målt meteorologiske målinger på stasjon 1 øst for Eramet.

4.1 Vindretning og vindstyrke

Vindretningen angis i prosent for vind fra en retning, med økende gradtall ”med sola”. Nordavind er fra 0°/360°.

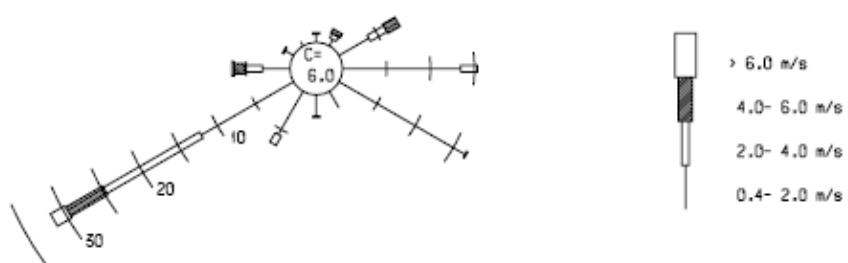

Frekvensfordelingen av vindretning for hele måleperioden og månedsvise frekvensfordelinger er vist i Figur 2. Dominerende vindretninger for hele måleperioden var fra øst og øst-sørøst (35,9%) og fra vest-sørvest (26,1%). Det var vindstille i 5,4% av tiden. Midlere vindstyrke for hele perioden var 1,6 m/s. De høyeste vindstyrkene forekom med vind fra vest (270°). Høyeste midlere vindstyrke var i mai (1,9 m/s), alle de øvrige månedene hadde vindstyrke på 1,5 m/s. Mer detaljert statistikk er vist i Vedlegg B. Figuren viser at for

sommeren 2011 var dominerende vindretning langs dalen slik det også var sommeren 2010. Dette stemmer med de generelle vindforholdene i landsdelen for disse periodene.

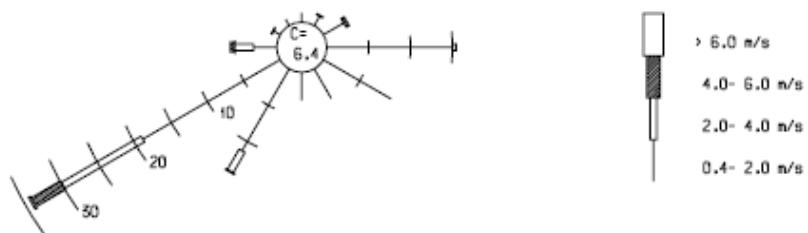

Figur 2: Frekvensfordeling av vindretning fordelt på 30°-sektorer fra Sauda i perioden 01.04-31.08.2011. Vindrosene gir prosentvis fordeling, og viser retningen det blåste fra. C=calm (vindstille).

Tabell 3 viser vindstatistikk fra Sauda for hele måleperioden.

Tabell 3: Vindstyrkestatistikk (m/s) for Sauda.

Måned 2011	Andel vindstille (%)	Midlere vindstyrke (m/s)	Maks timemiddel (m/s)	Tid for maks vindstyrke	Maks vindkast (gust) m/s	Tid for maks vind- kast
April	3,6	1,5	7,4	08. kl 08	19,9	08. kl 19
Mai	6,0	1,9	9,4	24. kl 05	20,2	24. kl 05
Juni	6,4	1,5	6,7	22. kl 14	14,0	14. kl 14
Juli	8,4	1,5	7,8	17. kl 13-15	17,7	17. kl 13
August	2,7	1,5	8,5	13. kl 21	18,0	13. kl 21
Totalt	5,4	1,6	9,4	24. kl 05	20,2	24. kl 05

Alle data finnes i Vedlegg B.

Vindstyrke som funksjon av vindretning på Sauda er vist i Figur 3. Vindretningssektoren med høyest middel vindstyrke var vest (270°).

Figur 3: Midlere vindstyrke fordelt på tolv 30 °-sektorer på Sauda i perioden 01.04.-31.08.2011.

4.2 Stabilitetsforhold

Vurderingen av atmosfærens stabilitetsforhold er basert på timevise målinger av temperaturdifferansen mellom 10 m.o.b. og 2 m.o.b. (ΔT). Forekomsten av fire stabilitetsklasser i Sauda i perioden 01.04.-31.08.2011 er gitt i Tabell 4. Ustabile og nøytrale stabilitetsforhold medfører vanligvis gode spredningsforhold, mens lett stabile og stabile stabilitetsforhold oftest gir dårlige spredningsforhold for luftforurensninger.

Typiske trekk for de ulike stabilitetsklassene kan kort sammenfattes slik:

Ustabile atmosfæriske forhold forekommer oftest om dagen og sommeren ved klarvær og lave vindstyrker og når kald luft transporteres over varm sjø/land. Da vil bakken/sjøen varme opp det nederste luftlaget, og det dannes vertikale turbulente luftstrømmer som gir god vertikal spredning av utslippet.

Nøytrale atmosfæriske forhold forekommer ved høye og moderate vindstyrker og oftest ved overskyet vær. Høy vindstyrke og mindre oppvarming av bakken gir god horisontal og vertikal spredning. Høye vindstyrker danner turbulens ved friksjon med bakken, slik at luftlaget vil bli godt blandet.

Stabile atmosfæriske forhold er typisk for stille, klare netter og vintersituasjoner med avkjøling av bakken og det nederste luftlaget, eller når atmosfæren avkjøles nedenfra på grunn av kald sjø. Temperaturen øker med høyden over bakken, og dette gir dårlig vertikalspredning i det stabile luftlaget.

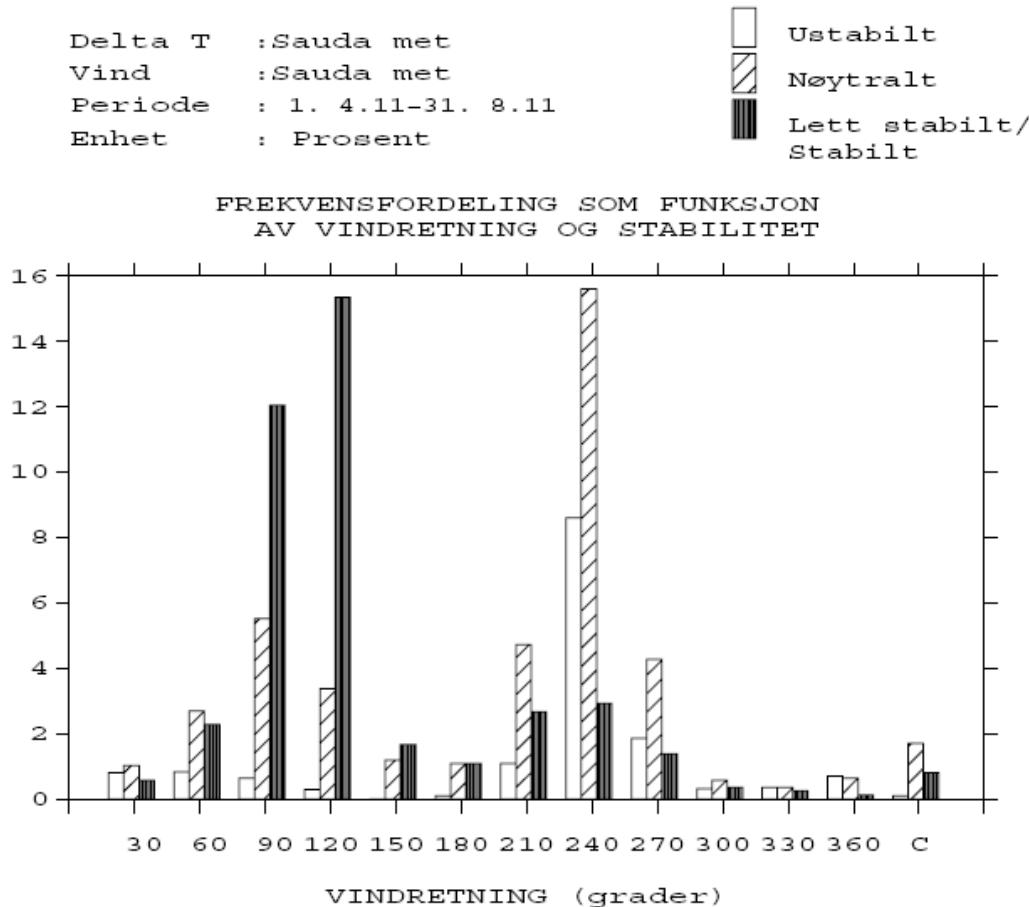

Tabell 4: Forekomst av fire stabilitetsklasser på Sauda i perioden 01.04.-31.08.2011. Enhet %.

Måned 2011	Ustabile forhold $\Delta T < -0,5^{\circ}\text{C}$	Nøytrale forhold $-0,5^{\circ}\text{C} \leq \Delta T < 0^{\circ}\text{C}$	Lett stabile forhold $0^{\circ}\text{C} \leq \Delta T < 0,5^{\circ}\text{C}$	Stabile forhold $0,5^{\circ}\text{C} \leq \Delta T$	Sum lett stabile og stabile forhold
April	19,4	24,3	47,9	8,3	56,2
Mai	21,8	66,4	10,4	1,4	11,8
Juni	15,6	54,2	24,1	6,1	30,2
Juli	14,9	43,4	32,1	9,5	41,6
August	8,1	38,2	37,5	16,3	53,8
Totalt	15,4	42,9	32,6	9,1	41,7

Tabell 4 viser at forekomst av nøytral temperatursjiktning var høy i hele perioden, slik det også var i fjorårets måleserie. Ustabil temperatursjiktning økte fra 19,4% i april til 21,8% i mai, for deretter å avta hele sommeren til 8,1% i august. Den samme trenden forekom også i fjorårets måleserie.

Stabile atmosfæriske forhold som fører til dårlig spredning av forurensninger, ble oftest observert ved vind fra øst. Stabile forhold ble observert 41,7% av måleperioden. De samme forhold ble observert ved fjorårets måleserie.

Stabilitetsdata finnes i Vedlegg C. Statistisk bearbeidelse av samtidige data for vind og stabilitet er gitt i Vedlegg D. Forekomst av ustabil, nøytral, stabil og lett stabil sjiktning fordelt på vindretning i 12 vindsektorer er vist i Figur 4.

Figur 4: Frekvens av ustabil, nøytral og stabil (og lett stabil) sjiktning fordelt på vindretning i 12 vindsektorer i Sauda i perioden 01.04.-31.08.2011.

Figuren viser at stabile atmosfæriske forhold oftest ble observert ved vind fra øst og sør-øst, under forhold med drenasjevind eller fralandsvind.

4.3 Temperatur

Månedsmiddeltemperaturene i Sauda i perioden 01.04.-31.08.2011 er vist i Tabell 5.

Tabell 5: Månedsmiddeltemperaturer i Sauda i perioden 01.04.-31.08.2010.

Enhet: °C.

Måned 2011	Måneds- middel Temperatur	Maksimum		Minimum	
		Temperatur	Tid	Temperatur	Tid
April	4,3	8,1	04. kl 15	-10,3	03. kl 04
Mai	-	-	-	-	-
Juni	13,1	21,0	16. kl 15	6,4	16. kl 05
Juli	16,1	24,8	14. kl 17	8,2	13. kl 05
August	14,7	23,2	03. kl 17	6,4	11. kl 05

5 Svevestøvmålinger

Det er utført kontinuerlige timemidlerte målinger av svevestøv (PM_{10} =partikler med diameter mindre enn 10 μm) på en stasjon ved bedriften (se Figur 1):

1. Søndenålia, nordøst for bedriften

NILU har sammenlignet måleresultatene med grenseverdiene i forskriftene til luftkvalitet fastsatt ved Kgl. Res. 4. oktober 2002 og nasjonalt mål for luftkvalitet.

Luftkvaliteten i et område vurderes ved å sammenligne målinger eller beregninger av konsentrasjoner av luftforurensning med grenseverdier sett ut fra virkning på helse og/eller vegetasjon. Begrepene grenseverdi og Nasjonalt mål er tallverdier for forurensningsgrad. Grenseverdier er juridisk bindende, men Nasjonalt mål er en målsetning.

Tabell 6 viser grenseverdier og nasjonalt mål for luftkvalitet.

Tabell 6: Grenseverdier og nasjonalt mål for luftkvalitet. Tallene i parentes viser hvor mange ganger grenseverdien tillates overskredet hvert år.

Komponent	Enhet	Midlingstid	Norske grenseverdier	Nasjonalt mål
PM_{10}	$\mu g/m^3$	Døgn År	50 (35) 40	50 (7)

Måleresultatene er vist i tabellform i Vedlegg F.

Tabell 7 viser middelkonsentrasjon, høyeste døgnmiddel og antall overskridelser for hver måned. Det ble observert totalt 2 overskridelser av døgnmidlet grenseverdi i denne måleperioden.

Tabell 7: Sammendrag av måleresultater for svevestøv (PM_{10}). Enhet: $\mu\text{g}/\text{m}^3$.

Måned 2011	Døgnmiddel		# døgn større enn $50 \mu\text{g}/\text{m}^3$
	Middelverdi	Maksimalverdi	
April	23,2	44,8	0
Mai	17,6	94,4	1
Juni	18,9	48,0	0
Juli	16,3	51,1	1
August	14,5	35,1	0

6 Metallanalyser

NILU har tidligere målt konsentrasjoner av ulike elementer (metaller) fra bedriftens utslipp fra eksisterende anlegg (Haugsbakk, 2009, 2010a, 2010b, 2011; Haugsbakk & Tønnesen, 2011). I Tabell 8 har vi sammenlignet alle målinger foretatt i hele måleperioden 2008-2011. Alle måleresultater for denne måleperioden finnes i vedlegg G, og er hentet fra Stasjonen Søndenålia.

Tabell 8: Sammenligning mellom målte maksimalverdier i 2008/09, apr-sep 2009, okt-2009-mars 2010, apr-sep 2010, okt 2010 – mar 2011 og apr – aug 2011 av ulike metaller. Enhet ng/m^3 .

Metall	Målte maksimal-verdier mars – august 2011	Målte maksimal-verdier oktober 2010-mars 2011	Målte maksimal-verdier april-september 2010	Målte maksimal-verdier oktober 2009-mars 2010	Målte maksimalverdier* april-september 2009	Målte maksimal-verdier oktober 2008-mars 2009
As	1,14	2,41	2,00	2,53	2,06 (1123)	6,00
Cd	1,10	0,84	2,13	1,73	0,53 (678)	20,31
Cr	3,71	2,66	4,63	7,89	32,46 (304)	6,56
Cu	3,62	2,83	3,99	5,96	4,11 (1821)	6,80
Hg	12,61	39,93	36,81	101,13	33,45 (49390)	95,78
Pb	25,06	24,44	16,55	197,52	9,03 (6968)	29,63
Mn	2144,87	1580,39	1 515,99	5 249,68	4 199,60 (463372)	2 749,18
Mo	0,24	0,25	0,24	0,08	0,21	0,23
Zn	37,06	62,68	100,59	144,05	76,01 (48443)	169,55
Ni	2,85	2,18	2,95	4,79	15,70	3,66
Co	2,24	1,19	2,22	4,31	5,26 (184)	2,10

*Resultatene fra 25. august 2009 var svært høye og er satt i parentes. Vi velger å tro at det den dagen skjedde noe usedvanlig eller at denne prøven er utsatt for noe spesielt.

Tabell 9 viser middelverdier for hele perioden.

Tabell 9: Middelverdier (ng/m^3) av alle metaller i hele måleperioden 01.04.- 31.08.2011.

	As	Cd	Cr	Cu	Hg	Pb	Mn	Mo	Zn	Ni	Co
Middelverdi	0,39	0,11	0,41	1,34	5,27	6,32	715,4	0,06	14,91	0,87	0,70

Det er ikke noe som tyder på andre kilder enn Eramet til forhøyede verdier av de ulike målte komponenter. Måleverdiene varierer også til dels mye. Dette kan forklares med en kombinasjon av vindforhold og variasjoner i aktivitet ved Eramet.

EU har "target values" som årsmiddel for tre metaller, verdier som ikke bør overskrides som årsmiddel:

As:	6 ng/m ³
Cd	5 ng/m ³
Ni:	20 ng/m ³

Norsk grenseverdi for bly som årsmiddel er: Pb: 500 ng/m³.
 WHOs retningslinje for Mn som årsmiddel er: Mn: 1000 ng/m³.

Måleresultatene viste i denne perioden en nedgang for de fleste målte parametre. Målingene for Mangan i perioden april-august 2011 viser maksimale døgnverdier som er 1,5 ganger så høye som WHO's retningslinjer for årsmiddel. Siden middelverdien for alle prøvene i 6 -månedersperioden er 715 ng/m³ tyder dette på at WHO's retningslinjer for årsmiddel på 1000 ng/m³ vil overholdes.

Vedlegg G inneholder alle resultater fra metallanalysene. Måleresultatene viser at det ikke er grunnlag for å anta at det vil bli overskridelser av noen grenseverdier og retningslinjer for de aktuelle komponentene. Målingene er sammenlignet med målinger foretatt på bakgrunnsstasjonen på Birkenes (Aas et al., 2010). Konsentrasjonsnivået i Sauda er en del høyere enn på bakgrunnsstasjonen på Birkenes, men konsentrasjonsnivået i Sauda er under gjeldende grenseverdier.

Mangan skiller seg som forventet ut med relativt høye verdier. Vi har ikke andre sammenlignbare målinger fra andre steder i Norge, men det er svært lite sannsynlig at så høye verdier vil forekomme andre steder.

Dersom konsentrasjonsnivået er høyt, vil det være naturlig å vurdere om andre kilder kan ha vært bidragsytere til de forhøyede konsentrasjonene. Vi kan ikke se at det finnes andre vesentlige bidragsytere enn Eramet til forhøyet nivå av de aktuelle komponenter i Sauda.

7 Konklusjon

NILU - Norsk institutt for luftforskning utfører på oppdrag fra Sauda kommune et måleprogram med meteorologi (vind, temperatur og stabilitet), luftkvalitet (PM₁₀) og metallanalyse av utvalgte filter fra svevestøvmålinger i Sauda. Denne rapporten er en delrapport for perioden 01.04.-31.08.2011.

De meteorologiske data gav dominerende vind opp og ned dalen som var et generelt trekk for hele regionen i denne perioden. Dette gir belastning mot stasjonen som er ganske lik sommeren 2010.

På målestasjon Søndenålia ble det i hele måleperioden registrert 2 overskridelser av grenseverdien for svevestøv (PM₁₀), på henholdsvis 51,1- og 94,4 µg/m³.

Metallanalysene viste i denne perioden en nedgang for tre av de målte parametre og en økning for de øvrige. Det ble målt relativt høye konsentrasjoner av mangan (Mn). For denne parameteren var det en økning i nivået sammenlignet med

målinger i de to forrige halvårsrapporter. Det er imidlertid ikke sannsynlig at konsentrasjonen av noen av de målte metaller vil overskride grenseverdier for luftkvalitet som årsmiddel.

TITTEL Målinger av meteorologi og luftkvalitet i Sauda april– august 2011		PROSJEKTLEDER Ivar Haugsbakk	
		NILU PROSJEKT NR. O-108070	
FORFATTER(E) Ivar Haugsbakk		TILGJENGELIGHET * A	
		OPPDRAKSGIVERS REF. Jostein Overskeid	
KVALITETSSIKRER: Dag Tønnesen			
OPPDRAKSGIVER Sauda Kommune Rådhusgata 32 Postboks 44 4201 SAUDA			
STIKKORD Meteorologi	Metallanalyse	Luftkvalitet	
REFERAT NILU har målt døgnmidlet meteorologi og luftkvalitet i Sauda kommune i perioden 01.04.-31.08.2011. I tillegg er det foretatt filteranalyser for innhold av metaller.			
TITLE Monitoring meteorological and air quality parameters in Sauda during the period of 01.04-31.08.2011.			
ABSTRACT NILU has carried out a monitoring program regarding meteorology and air quality in Sauda during the period 01.04.-31.08.2011. Filters have been investigated regarding several metallic compounds.

NILU er en uavhengig stiftelse etablert i 1969. NILUs forskning har som formål å øke forståelsen for prosesser og effekter knyttet til klimaendringer, atmosfærens sammensetning, luftkvalitet og miljøgifter. På bakgrunn av forskningen leverer NILU integrerte tjenester og produkter innenfor analyse, overvåkning og rådgivning. NILU er opptatt av å opplyse og gi råd til samfunnet om klimaendringer og forurensning og konsekvensene av dette.
